the first notable feature of this book is its innovation computational intelligence ci a fast evolving area is currently attracting lots of researchers attention in dealing with many complex problems at present there are quite a lot competing books existing in the market nevertheless the present book is markedly different from the existing books in that it presents new paradigms of ci that have rarely mentioned before as opposed to the traditional ci techniques or methodologies employed in other books during the past decade a number of new ci algorithms are proposed unfortunately they spread in a number of unrelated publishing directions which may hamper the use of such published resources these provide us with motivation to analyze the existing research for categorizing and synthesizing it in a meaningful manner the mission of this book is really important since those algorithms are going to be a new revolution in computer science we hope it will stimulate the readers to make novel contributions or even start a new paradigm based on nature phenomena although structured as a textbook the book s straightforward self contained style will also appeal to a wide audience of professionals researchers and independent learners we believe that the book will be instrumental in initiating an integrated approach to complex problems by allowing cross fertilization of design principles from different design philosophies the second feature of this book is its comprehensiveness through an extensive literature research there are 134 innovative ci algorithms covered in this book

a practical guide to geometric regulation for distributed parameter systems provides an introduction to geometric control design methodologies for asymptotic tracking and disturbance rejection of infinite dimensional systems the book also introduces several new control algorithms inspired by geometric invariance and asymptotic attraction for a wide range of dynamical control systems the first part of the book is devoted to regulation of linear systems beginning with the mathematical setup general theory and solution strategy for regulation problems with bounded input and output operators the book then considers the more interesting case of unbounded control and sensing mathematically this case is more complicated and general theorems in this area have become available only recently the authors also provide a collection of interesting linear regulation examples from physics and engineering the second part focuses on regulation for nonlinear systems it begins with a discussion of theoretical results characterizing solvability of nonlinear regulator problems with bounded input and output operators the book progresses to problems for which the geometric theory based on center manifolds does not directly apply the authors show how the idea of attractive invariance can be used to

solve a series of increasingly complex regulation problems the book concludes with the solutions of challenging nonlinear regulation examples from physics and engineering
